DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1 – 7 are rejected under 35 U.S.C. 102(e) as being anticipated by Jaudouin et al. (6,767,029).

As to claims 1 – 3, Jaudouin et al. (Jaudouin) discloses a vehicle seat comprising a detection means (18, fig. 2bis) for detecting physical relationship between a stationary rail (8) supported by a vehicle body and a movable rail (9) rigidly connecting a seat and sliding along the stationary rail; the detection means (18) includes a magnetic body (94a) provided at one of the stationary rail and the movable rail (9) and a magnetic sensor (18) provided at the other of the stationary rail (8) and the movable rail, and the magnetic body (94a) is arranged at an entire length of a specified region (P1, P2) in sliding direction of the movable rail, and a magnetic pole thereof is directed perpendicular to the slide direction, and the magnetic sensor (18) outputs a signal in response to magnetism from the magnetic body (94a).

As to claim 4, Jaudouin discloses that the magnetic body (94a) is not exposed outside of the fixed rail (8) or movable rail (9).

As to claim 5, Jaudouin discloses that the magnetic body (94a) is shaped as a sheet.

As to claim 6, Jaudouin discloses that the magnetic body (94a) is attached to one of the stationary rail (8) and the movable rail by magnetic attraction.

As to claim 7, Jaudouin discloses that the magnetic sensor (18) includes a Hall element for outputting a signal according to magnetic flux density and a switching circuit for outputting a signal when a voltage level of the signal from the Hall element exceeds a predetermined value (col. 7, lines 11 - 15).
